

## Method Z231 – Total ammonia NH<sub>4</sub> Marine water

### Specification

Description: Test for determining the total ammonia concentration in marine water  
 Range: 0,1 - 3 mg/l  
 Resolution: 0,05 mg/l  
 Wavelength: 610 nm

### Reagent set

Product Code	Description	List of components
8231	Set of reagents for method Z231, Total ammonia NH <sub>4</sub> Marine water (reagents for approx. 35 tests)	<ul style="list-style-type: none"> <li>✓ Reagent NH<sub>4</sub>-1</li> <li>✓ Reagent NH<sub>4</sub>-2</li> <li>✓ Reagent NH<sub>4</sub>-3</li> </ul>

### Performing the measurement

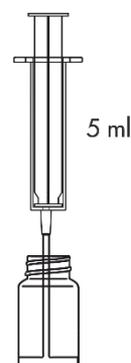

- Select the **Z231 Total ammonia NH<sub>4</sub> Marine water** method (Methods → Select method → Z231 Total ammonia NH<sub>4</sub> Marine). How to select the method, see [8.1 Choosing method](#).

**NOTE:**

It is recommended to use the **GUIDE** system by pressing the context button **GUIDE** on the photometer. It will provide you with step-by step basic instruction how to perform measurement and a timer with beeper to count down reaction time. To enable this function press the button **GUIDE**.

- Rinse the vial and the syringe three times with the tested water.

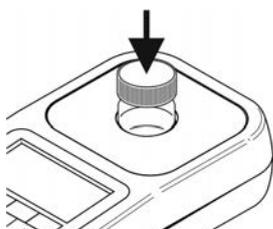

Take exactly 5 ml of the tested water with the syringe and pour into the vial.

**NOTE:**

Make sure no air bubbles are present in the syringe. Trapped air bubbles can affect accuracy of the measurement.

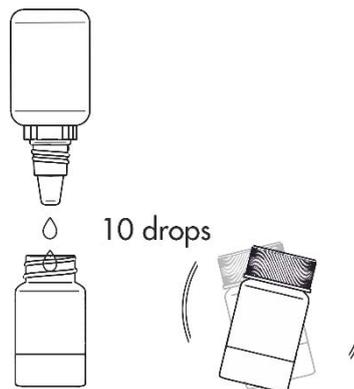

- Insert the vial into the round vial holder and press the **ZERO** key. The display will show **"-0.0-**", which means the device is ready for measurement.

4. Add 10 drops of **Reagent NH<sub>4</sub>-1** and shake to mix.
5. Add 10 drops of **Reagent NH<sub>4</sub>-2** and shake to mix.
6. Add 10 drops of **Reagent NH<sub>4</sub>-3** and shake to mix.
7. Before taking a measurement, wait exactly **10 minutes**.

8. Insert the vial into the round vial holder and press the **MEAS** key to take a measurement. The result – **the concentration of ammonium/ammonia** – is displayed in **mg/l (ppm)**.

There are also available alternative units to display: ppm and N mg/l. They can be accessed by pressing the **left / right** cursors on the keyboard.

The result acc. to method Z231 [mg/l]	The pH of the water				
	7,0	7,5	8,0	8,5	9,0
0,2	0,002	0,004	0,01	0,02	0,05
0,5	0,005	0,01	0,02	0,05	0,13
1	0,01	0,02	0,04	0,10	0,25
2	0,02	0,04	0,08	0,20	0,50
3	0,03	0,06	0,12	0,30	0,75
5	0,05	0,10	0,20	0,50	1,25

Harmful concentration

dangerous to aquatic life

**Table 1**  
Effect of pH on toxic ammonia release

It should be noted that in the presence of ammonium compounds, pH above 7 may become dangerous to aquatic life due to rapid conversion of harmless ammonium ions to toxic ammonia. For that reason, the content of ammonium compounds above 0,5 mg/l presents a potential risk.

## Potential interferences

too high or too low temperature	may cause false readings, maintain optimal temperature 25°C	
phosphate content	may cause falsely low readings	
high content of magnesium (Mg)	- above 2000 ppm	may result in precipitation
high content of calcium (Ca)	- above 600 ppm	may result in precipitation
